Q. What is caused by the annual motion?

A. The change and variety of the seasons.

Q. What is caused by the diurnal motion?

A. The succession of day and night.

* Being flattened at the Poles.

† The circumference of the earth is 24,872 miles, and its diameter is 7,914 miles.

‡ There is, also, a third motion of the earth, called the PRE-
CESSION OF THE EQUINOXES, which is a slow motion of the
two points, where the equator cuts the ecliptic, which are found to
move backward and forward fifty seconds every year.

Of the West Indies.

Q. What is meant by the West Indies ?

A. A certain number of islands on the east side of America, situated near the Gulf of Mexico.

Q. Which are the principal of the West India Islands ?

A. The principal are Cuba; Hispaniola, or St. Domingo*, Jamaica, Porto Rico, Barbadoes, Guadaloupe, Martinico, Tobago, St. Christopher's, Antigua, Barbuda, Anguilla, Dominica, St. Vincent, Grenada, St. Lucia, with several others of less note.

Q. Why are these islands called the *West Indies*?

A. They are so called from the following circumstance. Christopher Columbus, the discover of America, proposed to sail to the East Indies by a western course; but, instead of reaching Asia, he found America; still he was persuaded that those islands were the western part of India; and, before a sufficient number of voyages could be accomplished to convince him of his error, he died. From this mistaken notion the islands acquired the name of West Indies; besides to them from England we must sail to the westward; and, as we must sail to the eastward to go to *India*, the terms *East* and *West Indies* are not inapplicable.

Q. What is the population of the West India Islands?

A. Two millions six hundred thousand, of whom only four hundred and sixty thousand are whites.

Q. Are the black population of the British West India Islands, slaves?

Q. Are there any other islands in the world that we have not mentioned?

A. There are many other islands besides those already described; the principal are New Holland (which is larger than all Europe), Sardinia, Sicily, Corsica, Ivica, Minorca, Majorca, Candia, Cyprus, Rhodes, New Norfolk, New Guinea, Van Dieman's Land, New Britain, New Zealand, &c.; and those of the Pacific, viz.; the Society and Friendly Isles, with Otaheite, &c.

* Now an independent Republic of Blacks, called Hayti.

CHAPTER LII.

Of the Earth's Roundness.

Q. It is mentioned in Chapter I. that the earth is nearly round, like an orange; can you give me any reason why it is of such a shape?

A. Yes, because no other figure than that of a *sphere* could produce the pleasing and regular succession of day, and night, and the variety of the seasons.

Q. What is meant by a *sphere*?

A. The earth is sometimes called a *sphere*, sometimes a *spherical body*, and sometimes a *globular body*; but, whether we use the terms *globular*, *spheroid*, *sphere*, or *spherical*, it is always to be understood as a globe, that is, a circular body, which these terms signify.

Q. How is the earth represented by geographers?

A. By an artificial globe, on which the various parts of the surface of the earth are delineated; therefore it is to conceive that, if a map of the world be accurately drawn on any round body or globe, the surface of that globe will represent the surface of the earth.

CHAPTER LIII.

Proofs of the Earth being round.

Q. What proofs have we that the earth is *spherical*?

A. From viewing distant objects; for instance, a ship, going out to sea, gradually disappears to a spectator upon land, and the last part of the ship visible is the top of the mast; on the contrary, if a ship be advancing towards him, the top of the mast comes first into sight, then the shrouds, and afterwards the hull, which could not be the case, if the earth were not spherical. On a plain surface the largest objects are seen at the greatest distance.

Q. What other proof have we?

A. From an eclipse of the moon: for the shadow of the earth falling upon the moon is always circular; which

could not be unless the earth was globular ; because a body must be a globe, which in all situations casts a circular shadow.

Q. These are proofs, certainly, that the earth must be a globe ; but is it not a great mystery how the earth is situated relative to the heavenly bodies, what supports it ; and, as it is peopled on all sides, why do not its inhabitants fall from their impending situations ?

A. The earth is situated in open space, resting upon nothing, but supported by gravitation, which draws all terrestrial bodies towards its centre ; and may be compared to a great magnet rolled in filings of steel ; consequently there is no danger of falling from any one side of the earth more than from any other.

Q. What is meant by gravitation ?

A. Gravitation is a law in nature, which all bodies have, tending to a central point, called the centre of gravity.

CHAPTER LIV.

Of the Difference and Distanœe of a Mile in different Countries.

Q. Is the measurement of a mile the same in every country ?

A. No, very different, for the English mile is much less than the Indian ; and the Indian than the Spanish ; the Spanish than the German.

Q. What is an English statute mile ?

Q. What is a Russian mile ?

Of the Equator, &c.

Q. What is the Equator, and why is it so called ?

A. The Equator* is a great circle, which divides the earth into two equal parts at an equal distance from each pole ; and is so called, because, when the sun is in this circle, the days and nights are equal to all the inhabitants of the earth.

Q. What are the poles ?

A. The poles are two points of the earth opposite to each other, the one called North and the other South. These points are only imaginary, as also are the circles.

Q. Why are these points distinguished by the names of North and South poles ?

A. Because they are opposite to the North and South parts of the heavens.

Q. Of what use is the Equator ?

A. All parts of the earth, with respect to their situations, are either to the North or South side of the Equator ; and the distance of places, called their latitude, is counted from it towards the North or South pole.

Q. How far are the poles from the Equator ?

A. Ninety degrees, which is the fourth part of a circle,

* The Equator is sometimes called the *Equinoctial Line*, and sometimes only the *Line*.

called a quadrant ; half a circle is 180 degrees, and a whole circle, whether great or small, is 360 degrees.

Q. What are the tropics ?

A. Two lesser circles called Cancer, and Capricorn. The tropic of Cancer is $23\frac{1}{2}$ degrees north of the Equator, and the tropic of Capricorn $23\frac{1}{2}$ south of the Equator.

Q. What are the polar circles ?

A. Two lesser circles, called Arctic and Antarctic ; the arctic or north polar circle, is $66\frac{1}{2}$ degrees from the Equator, and the antarctic or south polar circle, is the same distance south of the Equator. The polar circles are also $28\frac{1}{2}$ degrees from the poles.

CHAPTER LVI.

Of the Circles of the Globe.

Q. What names are given to those lines or circles that surround the globe ?

A. The principal circles which surround the globe are the equator, the ecliptic, the tropics, the polar circles, and the meridians.

Q. What is the ecliptic ?

A. The ecliptic is a great circle described by the sun in the space of a year. It surrounds the globe between the two tropics, and crosses the equator at two opposite points, called the equinoctial points.

Q. What are the meridians ?

A. All lines drawn from one pole to the other are called meridians. When the sun comes to the meridian of a place, it is then noon or mid-day at that place, for every place has a meridian. The meridian or line, drawn from north to south over Greenwich, is called the first meridian, and the longitude of places is reckoned from it either east or west.

Q. What is meant by the horizon ?

A. There are two horizons ; one called the sensible or visible, and the other the rational horizon. The sensible horizon is the boundary of our sight, being that circle where the sky and earth seem to meet. The rational

horizon cuts the earth into two equal parts, and is parallel to the sensible horizon.*

Q. What are the poles of the horizon called ?

A. The Zenith and Nadir ; the Zenith point is that part directly over head ; and the Nadir is that point, opposite to it, under our feet.

Q. What are the four cardinal points of the horizon called ?

A. North, east, south, and west.

Q. How is a circle divided ?

A. All circles are divided into 360 parts, called degrees. The half, or semicircle, is 180 degrees ; the quarter, or quadrant, is 90 degrees.

Q. How is a degree divided ?

A. A degree is divided into 60 minutes, and every minute into 60 seconds.

Q. How many kinds of circles are there ?

A. Two, the *great*, and the *less circles*.

Q. What is a *great circle* ?

A. A *great circle* is that which divides the earth into two equal parts.

Q. What is a *less circle* ?

A. A *less circle* divides the earth into two *unequal* parts.

Q. What is the admeasurement of a degree in a great circle ?

A. A degree in a *great circle* contains 60 geographical or $69\frac{1}{2}$ English miles, but the admeasurement of a *less circle* varies accordingly as it approaches towards the poles.

Q. What is a mile called in geography ?

A. A minute.

Q. How many degrees make an hour of time ?

A. Fifteen.

* The broad wooden frame which supports an artificial globe represents the rational horizon.

CHAPTER LVII.

Of Latitude and Longitude.

Q. How are places upon the earth distinguished ?

A. By their situations, which are obtained by their latitude and longitude.

Q. What is meant by the latitude of a place ?

A. Its distance north and south from the equator. If it be on the north side of the equator, it is said to be in the north latitude ; if on the south side, in south latitude. All places on the earth are either in north or south latitude, except at the equator, where there is no latitude, because latitude begins there.

Q. What is the greatest latitude a place can have ?

A. Ninety degrees, and there are only two places that have so much, which are the poles.

Q. What are the parallels of latitude ?

A. Parallels of latitude are lines drawn at an equal distance from the equator.

Q. How is the latitude of a place found ?

A. Upon a globe it is found by turning the globe round till the place comes under the brass meridian in which the globe is suspended, which shows the distance from the equator. But upon a map the latitude is found at the side ; if it increases upwards, it is north ; if downwards, it is south.

Q. What is meant by longitude ?

A. Longitude is the distance of a place from the first meridian to the east or west. If it is on the east side, it is east longitude.

Q. What is the greatest longitude a place can have ?

A. One hundred and eighty degrees, which is one half of the circumference of the globe. All places are either in eastern or western longitude, except under the first meridian, which has no longitude, it being there where longitude begins.

Q. How is longitude found ?

A. Upon a globe it is found at the equator, but upon a map at the top and bottom. •

CHAPTER LVIII.

Of the Zones.

Q. What are the Zones ?

A. Certain spaces that encompass the earth like a belt.

Q. How many zones are there ?

A. There are five zones, namely one torrid, two temperate, and two frigid or frozen zones.

Q. Where is the torrid zone, and why is it so called ?

A. The torrid zone includes all that part of the earth which is situated between the tropics, and is denominated torrid, or burning, because of the great and continued heat of the sun, under whose course it lies.

Q. What are the temperate zones, and why are they so called ?

A. The temperate zones include all those parts of the earth which are situated between the tropics and polar circles ; within the two extremes of heat and cold, which renders the air more temperate, on which account these parts are much more improved.

Q. Where are the frigid zones situated, and why are they so denominated ?

A. They are situated between the polar circles, extending round each pole, and are called frigid or frozen, from the rays of the sun falling so very obliquely on those parts, which renders it excessively cold.

• The degrees of longitude are not equal, like those of latitude, but diminish in proportion as the meridians incline towards the poles. Hence, in 60 degrees of latitude, a degree of longitude is but half the quantity of a degree upon the equator, and so in proportion for the rest.
